

## vDrive<sup>QL</sup> Firmware Update 002

Before updating the firmware, check the existing version by executing the toolkit `VINFO` command. If the existing version of VDRV is 2.03 or lower, FSYS is 2.01 or lower, or TKQL is 1.07 or lower, then this update applies.

After the update `VINFO` will show:

```
VDRV v2.05  
FSYS v2.02  
TKQL v1.08
```

To update the firmware please refer to the latest version of the vDrive<sup>QL</sup> user manual.

### Patch Notes 17/08/18

- Added `VSTD/VSWAP` status in `VINFO`.
- Added beep when `vMap` command executed.
- Fixed several edge case defects in address decoding.
- Fixed defect in the extended command handling whereby a command would time out if executed after an access to an empty vDrive.
- Added simulation of corrupt data on initial drive access as 'perfect' data was causing some applications to reject the cartridge image (notably The Pawn for save and restore).
